

***Fiscal Underpinnings for Sustainable Development in China: Rebalancing in Guangdong.***

Ehtisham Ahmad, Meili Niu and Kezhou Xiao (eds)

Springer (2018)

Fiscal policies to ensure sustainable development must address the management of risks, address spatial imbalances and interpersonal inequality; and improve the environment and quality of life, and are highlighted in the volume on Sustainable Development in China. Reflecting the broad policy choices in China in the recent past and in the immediate future, the volume also illustrates the challenges and opportunities in the context of Guangdong, which has piloted many of the economic reforms since the early 1980s. Most of the papers are by distinguished Chinese academics, and policy makers with a deep understanding of the Chinese context. They provide a basis for additional work in defining policy options that are consistent with the priorities of the medium-term action plan of the government, announced in December 2017.
